

Crown[®] giving warm weather pests a cold shower

The warm weather isn't just perfect for a picnic or a dip in the pool, it's also high season for pests. The problem is how to send them packing without risking plant phytotoxicity. According to Robert Megier, Scotts' Regional Sales Manager, NSW, "Crown works both on contact with target pests, and systemically through root and leaf uptake. There have been a number of pests done on Crown proving its fast knockdown of sucking insects and continuing effectiveness over longer periods of time."

Incorporating Acetamiprid chemistry, Crown targets all sucking insects acting on the eggs, larvae and adults. It can be used in rotation with other insecticides like Scotts Procide 80SC to provide effective control of a range of insect pests.
