

Hydraflo® helps turf deal with drought

Maxwell and Kemp, Milperra NSW

It is true that there are many wetting agents on the market. Some people would say that there's not much difference between all of them, but those people have probably never used a really good wetter. Chris Blagg and the team at Maxwell and Kemp recommend Scotts Hydraflo to their customers, and this season more than ever it has proved itself to be a standout technology.

Maxwell and Kemp recently staged a seminar at Newcastle Golf Club, which brought together golf superintendents from in and around Sydney for what could best be described as a 'think tank'. Audience participation was the order of the day and there was no shortage of that, as the group openly shared their opinions and experiences on a range of turf issues.

Maxwell and Kemp recommend Hydraflo because it is a high quality wetting agent. With a significant number of attendees having acted on such recommendations, strong praise was forthcoming from the audience about Hydraflo working reliably, every time. In the end it was Mark Parker from Concord Golf Club who chimed in with some useful advice that was relayed to him by Dave Warwick from Avondale Golf Club.

At Concord Mark applies Hydraflo through an injection system installed on the outlet side of his irrigation pump. Mark advised that wetting agent applications to fairways have always produced headaches when trying to irrigate close behind the spray tank. Applying Hydraflo through the irrigation system not only overcome this problem, it saves significant manpower and it has reduced irrigation patterns that inevitably appear in the drought conditions Sydney has been experiencing. Although Mark does not apply fertiliser or pesticides via injection, he believes that wetting agent makes real sense.

Congratulations to the team at Maxwell and Kemp on a really good day at Newcastle, for customers and trade partners alike. Oh, and keep up the good work with Hydraflo guys.

Hydraflo

Hydraflo L is Scotts liquid wetting agent available in 5, 20 or 200 litre pack sizes. For those who would rather the convenience of a dry application, Hydraflo 2 is a granular formulation with 15% loading of active ingredient. Hydraflo 2 is clean and simple to apply through an Accupro 2000 spreader. When evening irrigation is the only alternative, Hydraflo 2 can be applied in the afternoon and left on the surface without risk, until irrigation can be scheduled to activate the wetting action of Hydraflo.
